

# @decorator export Ordering

Daniel Rosenwasser, Ron Buckton

## Background

- In 2015, TypeScript implemented an early version of decorators behind a flag.
- TypeScript 5.0 Beta implements decorators as per stage 3.
  - Becomes the default – “old” decorators are still available via the same flag.
  - Full support planned for stable release in March
- TypeScript’s early version of decorators slightly differs in syntax from the current proposal’s.

# Decorators first

```
@decorator(  
    // ...  
)  
export class C {  
    // ...  
}
```

export first

```
export @decorator(  
    // ...  
)  
class C {  
    // ...  
}
```

## Why the change?

- One reason: theoretical ability to decorate a local, but not an export
  - <https://github.com/tc39/proposal-decorators/issues/135>
  - Idea is that a future proposal could use the decorators-before syntax.

The issue with  
that

```
@decorator
export class Foo {
    static makeSpecialFoo() {
        return new Foo();
    }
}

let x = new Foo();
```

## The issue with that

```
@decorator
export class Foo {
    static makeSpecialFoo() {
        return new Foo();
    }
}

let x = new Foo();
```

- We think this is a **major footgun**.
- It would be bad if **Foo** referred to the pre-decorated class.
- Too subtle.

Also: lack of  
positive  
feedback

- Feels like most of us preferred the original syntax
  - But we've resisted discussing it further.
  - Nobody wants to "deadlock" the proposal.
- TypeScript's syntax has shipped for almost 8 years.
  - Almost no demand for **export @decorator**
    - which was brought up at least 5 years ago.

So where are  
we?

- The TypeScript team would not support making a semantic distinction between

`export @decorator`

and

`@decorator export`

- We are okay with expanding the syntax, but **not** differing semantics.

Can we make a change?

- We believe there's no future for differing semantics based on ordering.
- The previous syntax is already widely-used – it would make upgrades harder.
- Anecdotally, most library authors that shipped class decorators prefer the “old” ordering.

We would like to request one of the following changes to the decorators proposal.

- Option 1: Decorators are placed **before** the **export** keyword.
  - *Our preference*
- Option 2: Decorators can be placed **before or after** the **export** keyword.
  - Preference for exclusive-or
